

How to create a democratic world government

www.voteworldgovernment.org

1. Within any nation or province or city, the fundamental choice is between government (the rule of law) and anarchy (the “law of the jungle”).
2. While no government is perfect, serious people reject anarchy.
3. Governments are either democratic or dictatorial, and given a real voice in the matter, people will choose democracy, overwhelmingly.

These three statements are also true for the world as a whole. Without a world government to make “**world law**,” nations will continue to make war, and terrorists will continue to kill innocent civilians for political gain. With nuclear, chemical and biological weapons in the mix, a World War III may well destroy all life on Earth. As well, we face an immediate global warming crisis. Most people already know about these dangers, but they *incorrectly* think they are helpless to change anything on the world stage.

The United Nations is a **gathering place of national governments**. It is not, and can never become, the democratic world government that we need. We believe that by **using the Internet, we can conduct a global referendum**—or at least kick-start the process—and obtain a **strong global mandate** from the **entire human race** in favour of the creation of a directly-elected **world parliament** that would be empowered to repair the environment and resolve all international conflicts by world law. The real test will be whether such a mandate would be “**legally binding**” on national governments. Our research says it will, and we believe that this is what it will take if future generations are to live their lives without experiencing an environmental collapse or war. We have to create the conditions under which humans can survive and thrive for millions of years into the future, and now we know how to do it.
